

Spout to NDI

<http://spout.zeal.co>

Convert between Spout and Newtek NDI sources.

Using the [Newtek NDI SDK](#)

<http://NDI.NewTek.com>

Version 2.005

"*Spout to NDI*" is a set of programs that allow Spout senders and receivers to share video, not only with each other but also by way of a network using the [NewTek](#) NDI ("Network Device Interface") protocol Version 3.8.

For more information about the NDI protocol see [here](#). This link is also available at any time by selecting Help > About.

1. Installation

Unzip "*SPOUTtoNDI_2005.zip*" in any convenient folder.

Folders

SpoutToNDI\bin – contains the conversion programs

Runtime libraries

Before running any of the programs, install the [NDI tools](#) so that the the necessary Visual Studio 2013 runtime libraries are installed.

Spout to NDI programs are built using Visual Studio 2017. Runtime dll files are included in the \bin folder. All the programs should run without further installations.

However, if you find that the programs still report missing dll's, you may need to install the Visual Studio 2017 runtime manually.

[Download from here](#). Scroll down to find "Microsoft Visual C++ Redistributable for Visual Studio 2017". Download both the x64 and x86 versions. Install the x64 version before the x86 version.

2. Operation

2.1 SPOUT to NDI

Start a Spout sender, such as the demo sender provided with the Spout installation. Then start "*Spout to NDI.exe*", located in the "bin" folder.

You might receive a warning about Firewall access because it is necessary for data to be transferred across a network.

Allow access as you require.

The demo Spout sender will be immediately selected. Subsequently you can RH click and select other Spout senders.

The sender is now available to any NDI receiver on the network.

To confirm this, start the Newtek Tools "Video Monitor" as as described [below](#).

You can repeat the test on another computer on the same network.

Notice that the name of the sender is preceded by the name of your computer as it is identified on the network. For example, if your computer is named "MY COMPUTER" you will see the demo sender as :

"MY COMPUTER (Spout DX11 Sender)"

Settings

Choose NDI sender options using "File > Settings" from the menu.

Fps

Enter the frames per second you wish to send to NDI, e.g. 29.97, 25 etc. The sender will be received at that rate.

YUV output

This creates a sender in YUV (UYVY) format which is the most efficient for NDI throughput. The Openframeworks RGBA texture is converted to YUV using a shader for maximum speed.

Asynchronous sending

This option activates an asynchronous sending mode where frames are sent without waiting until the previous one has been processed. The NDI system manages the buffering and synchronisation. This is the fastest sending method, and will over-ride the entered fps.

Texture readback buffering

This increases efficiency of the transfer of GPU texture to CPU image pixels required by NDI. Disable if it causes problems such as stuttering. Otherwise it gives a significant improvement in performance.

2.2 NDI to SPOUT

If you have NDI senders running you can receive any one of them and produce a Spout sender which can then be used to share textures between applications on the receiving machine just as they would be on the source machine.

After installation of NDI tools, find the "Test Patterns" application and open it. An NDI sender will then be available on the network.

Then start "*NDI to Spout.exe*", located in the "bin" folder.

This can be started on any machine on the network but for testing start it on the source machine.

Now the NDI sender test pattern is being received and the output is a Spout sender of the same name preceded by the name of your computer as it is identified on the network. Run the Spout demo receiver and you will see it listed. It will also be available in any program that supports Spout input such as [Resolume](#) or [Magic](#).

Selecting a sender

Right click to bring up a dialog with a list of NDI senders currently available on the network and select the one you want. In this case you can see the test pattern application as well as "Spout to NDI" which is also running and receiving from "Test pattern"

Sometimes the network may be temporarily unavailable or some other problem and NDI senders might disappear and re-appear in the list. This will not affect the selected sender and when that NDI sender comes back on line, the frames will resume. It may take some seconds for discovery of all the NDI senders on the network.

3. Other utilities

3.1 NDISyphon

"*NDISyphon*", developed by [VidVox](#), is the equivalent of "*Spout to NDI*" but for OSX using [Syphon](#) instead of *Spout*.

OSX machines using "*NDISyphon*" and Windows machines using "*NDI to Spout*" can communicate and share video.

3.2 NDI tools

You can register with [Newtek](#) to receive a download link for useful tools. You will receive an email with a link to download the [NDI Tools](#).

These include a "Test Pattern" sender, a "Video Monitor" to receive from NDI senders and a "Scan Converter" screen capture application, which are most useful for use with *Spout to NDI*.

4. Licencing

4.1 Spout to NDI

"Spout to NDI" is released under the Simplified BSD licence.
